/note="Organ: pooled; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHL19W, testis NHT, and B-cell NCI_CGAP_GCB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo. "

/note="Corgan: mixed (see below); Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_l: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (melanocyte 2NbHM, pregnant uterus NbHPU, and fetal heart NbHH19W) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 260232-265223, 340488-345479, and 484488-489479."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AQ841408 558 bp DNA GSS 27-SEP-1999

/note="Organ: antennae; Vector: Uni-ZAP XR; Site_1: ECORI;
Site_2: XhoI; The library was prepared by Stratagene using
oligo-T priming and unidirectional cloning with an
adaptor at the 5' end (GGCACGAG) following the EcoRI
site. The mRNA was prepared from antennae of late pupal
and newly eclosed male moths. Clones were subcloned in
vivo in mass into pBluescript maintained in SOLR cells
for DNA sequencing."

```
/lab_host="E. Coli strain XL10-Gold, T1-resistant, F-"
/note="Vector: PwD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pwD42 (gil4732114|gb|AF129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                              ô
                                                                                                     A DNA tag (T72784) having HindIII, SfiI, NotI and a defective
C HindIII site is used to tag human DNA from malignant, metastatic
C cancer cells in a novel method of screening and recovering
C metastasis-inducing DNA (Met-DNA). This method involves
C transferring the human DNA into a cell line (pref. rat Rama 37)
C that produces only benign, non-metastasing tumours when injected
C into a syngeneic animal, injecting the transformed cells into a
C syngeneic animal, selecting those animals having metastasing
C tumours, and recovering the Met-DNA (see also T72785-90) from them.
C The human DNA is tagged to assist in its removal or insertion from
C or into a host or vector. The tagging procedure overcomes the
C problem of identifying the inserted human DNA sequences in the rat
C genome of the transfected cells.

The primer can be used in a novel method for the production of recombinant antibodies, comprising the selection of B cells from a lymphocyte fraction, isolation of mRNA from individual B cells, reverse transcription of the mRNA into cDNA, amplification of the cDNA by PCR and cloning and expression of the cDNA. The recombinant antibodies can be used for diagnosis and/or therapy, while the method avoids the need for intermediate separation of light and

The invention provided isolated human semaphorin K1 polypeptides. The polypeptides, or nucleic acids encoding them, can be used to modulate cellular physiology by modulating semaphorin K1 activity, e.g. semaphorin K1 polypeptide fragments or antisense nucleic acids can be used to enhance neurite outgrowth from damaged neurons. The polypeptides can also be used as immunogens, reagents for isolating other semaphorins, or as reagents for screening chemical libraries for lead pharmaceutical agents. The nucleic acids can also be used as probes and primers for diagnostic
                                                                                                                                     encode immunogenic polypeptides. The T. gondii nucleic acid molecules, immunogenic proteins and antibodies to the proteins can be used to inhibit T. gondii oocyst shedding in a cat due to infection with T. gondii. They can be used for preventing T. gondii infection and for preventing the spread of T. gondii infection. They can also be used for detecting T. gondii infection. The detection method can be used to detect parasite cysts or oocysts in feces, e.g. from enteric apicomplexa oocysts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   physiology; neurite outgrowth; neuron; human;

The DNA also encodes an open reading frame, needed for SLDH activity in vivo. Host cells transformed by a vector comprising the SLDH DNA sequence are used for the recombinant expression of the sorbitol dehydrogenase. Recombinant D-sorbitol dehydrogenase is useful for producing L-sorbose from D-sorbitol. L-sorbose is an important intermediate in vitamin C production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Prototype Stealth virus clone; atypically structured virus; vacuolating cytopathic effect; cytopathic virus; virus detection; malignancy; multiple myeloma; lymphoma; brain tumour; breast cancer; salivary gland tumour; Alzheimer's disease; Parkinson's disease; spongiform encephalopathy; multiple sclerosis; schizophrenia; manic depression; major depression; personality disorder; autism; Rett's syndrome; attention deficit; oppositional defiance; aggression; anorexia nervosa; bulimia; multi-system illness; virus infection; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

clones. The sequences illustrate the type of sequences that can be used to generate probes and to predict antigenic and biologically active products obtainable from a viral isolate, in the methods of the invention. The specification describes tissue culture, serological and molecular based methods to detect atypically structured viruses, such as Stealth viruses, which are able to induce a vacuolating cytopathic effect (CPE) in tissue culture, and are distinguishable from known cytopathic viruses, by appearance progression and/or host range, or by serological, electron microscopic and/or molecular markers. The products can be used for detecting viruses in patients with diseases such as a malignancy, e.g. multiple myeloma, lymphoma, brain tumours, breast cancer, salivary gland tumours, Alzheimer's disease, spongiform encephalopathy, multiple sclerosis, schizophrenia, manic depression, major depression, personality disorders, autism, Rett's syndrome, attention deficit, oppositional defiance, aggression, anorexia nervosa, bulimia, a multi-system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

This sequence represents a Stealth virus nucleic acid clone. The invention relates to a method of detecting and characterising a stealth virus by reacting a sample suspected of containing a stealth virus with a probe from a known stealth virus and sequencing the resultant isolated nucleotide. The method comprises the steps of: (a) isolating DNA or RNA from a sample suspected of containing a stealth virus, e.g. a culture of from a sample suspected of containing a stealth virus, e.g. a culture of cells showing a viral cytopathic effect; (b) testing the reactivity of the isolated DNA or RNA with a molecular probe that contains at least 18 or more contiguous nucleotides identical to sequence previously identified from a stealth virus; and, optionally (c) sequencing the isolated DNA or RNA molecules that react with the probe. The method is used to detect stealth virus in a biological product, food or in the environment. The method is also used to evaluate agents for their inhibitory or stimulatory effects on stealth virus replication and to determine capacity of the virus to recombine with and potentially alter
                                                                                                                                                    maintain the

```
Ten new olfactory receptor proteins and their biallelic markers have been described. The sequences encoding these receptor proteins and which contain the biallelic markers can be used for genotyping. The olfactory receptor proteins can be used to screen for substances which bind to them. See GENESEQ records 293816-25 and Y83386-95.

                                                                     complementary to the lambda DNA sequence adjacent to the cloning for the cDNA insertions (see Q70113-14). In addition, primers we designed which were complementary to the plus strand of the most region of the EK coding sequence (see Q70115-16). Subcloning and sequencing provided a 116 amino acid EK heavy chain. This prote contained regions corresp. to tryptic peptides (see R57295-9).

sequence that corresponds to the sequence represented by position 3950 to about 2390 and from position 3948 through position 2398 of N81768 is claimed. Also claimed is a peptide sequence that consists of a 5-40 AA residue sequence that corresponds to a sequence of the 540 AA residue protein (P81351) or the 517 AA residue protein (P81868) coded for by the DNA sequence. The proteins can be used for determining previous immunological exposure of a mammal to M.tuberculosis or M.bovis and for producing a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The gene was isolated by probing a lambda gtll expression library of M.tuberculosis DNA with monoclonal antibodies directed against M.tuberculosis-specific antigens. The 19kD, 71kD and the 65kD proteins and genes are claimed, and so is a vaccine comprising DNA encoding M.tuberculosis protein in a recombinant vaccine vector. P80216 is encoded on the complementary strand.
                                                                                                                                                                                                                                                                                                                                       Gaps

This protein cross-reacts with a component of articular cartilage, human Hsp60, that is up-regulated in the joints of arthritic patients. A claimed method for treating or preventing an autoimmune disease in a mammal comprises: (a) providing a particle coated with an antigen against which an immune response is mounted in the autoimmune clisease; (b) delivering the particle into the recipient cell of the mammal, and (c) repeating step (b) until either a reduction in a cytotoxic immune response or a desensitizing immune response is induced in the mammal. Alternatively, step (a) comprises providing a nucleic acid construct comprising a coding sequence for the antigen, operably linked to control elements such that the coding sequence can be transcribed and translated in a recipient cell, and delivering the construct to the recipient cell using a gene gun.

The antigen of step (a) is selected from collagen, Mt Hsp65, myelin basic protein, myelin oligodenfocyte glycoprotein, protein, and epitopes thereof. These antigens mitigate cytotoxic responses and elicit antigen desensitisation. The method is used especially for treating rheumatoid arthritis or multiple

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and lung cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 7, Application US/08042747A

Sequence 7, Application US/08042747A

Patent No. 5487969

GENERAL INFORMATION:

APPLICANT: Eberle, Richard

APPLICANT: Black, Darla

APPLICANT: Hilliard, Julia K.

TITLE OF INVENTION: Cloning and Amplification of Mor

TITLE OF INVENTION: Virus Genes

NUMBER OF SEQUENCES: 12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              OPERATING SYSTEM: PC-DOS/MS-DOS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 28, Application US/08853659A
Patent No. 5925522
GENERAL INFORMATION:
APPLICANT: Wong, K.K.; Saffer, J.D.
TITLE OF INVENTION: A Salmonella Sequence, Methods Of Detection
TITLE OF INVENTION: Salmonella Sequence, And Methods Of Detection Of
TITLE OF INVENTION: Salmonella Sequence, And Methods Of Detection Of
CORRESPONDENCES: 67
CORRESPONDENCE ADDRESS:
ADDRESSEE: Paul W. Zimmerman
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 638;

On Jun 29, 1999 this sequence version replaced gi:5262835.
This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Note that the
